Abstract:

WO 9014935 A

Mouldings for structural applications, insulation and/or packaging, and pref. made of chipboards, and/or fibre prods. and/or boards, are produced by extruding at high temp. and pressure a material made up of particles (and partic. fibres) mixed with at least one binder and (where appropriate) additive. The fibrous material has a total moisture content of 6-25 wt.% and 8-20 wt.% in partic.; alternatively this applies to the additive material. The material is mixed with a biopolymeric (pref. starch type) binder which forms a melt and/or gel at the temp. and pressure of extrusion; the fibrous material used is pref. in biogenic and macromolecular particles; any additive used is also present. The mixt. is subjected to mechanical stresses at the elevated temp. and pressure to form the melt and/or gel; immediately, and pref. forming a sealed surface on the extrusion, the mixt. is allowed to expand by releasing its pressure so that it reaches a natural/inherent moisture content. The material used pref. includes a bi-functional modifier such as short chain di- or polycarboxylic acids, di- or polythiols or derivs., or mols. contg. tert. amino gps.

ADVANTAGE - Mouldings are prepd. by using conventional extruders without adding binder beforehand and produces them in one single operation. It utilises raw materials which are environmentally favourable. The prods. are highly isotropic and have lower density but higher mechanical stability than earlier prods.

Dwg.1/2

EP 477203 B

A process for the mfr. of materials for use in the construction industry, or as structural or packaging materials, made by producing shaped parts from moist, natural, fibre-contg. or fibre-shaped material and a binder, which are mixed and compacted in a screw extruder having a shape-imparting nozzle attached, characterised in that (a) at least one biopolymeric, natural material is used from at least one of the following gps.: starches, dextrans, pectins, collagens, proteins or caseins, (b) the water content of the mixt., relative to the total mass, is adjusted to 6-25%, (c) through the effects of compaction and shear forces applied in the screw extruder, the pressure and temp. of the mixt. is increased until the binder melts to form a gel, (d) immediately after it is formed, the molten gel mixt. is decompressed in such a way that as the finely dispersed moisture content undergoes spontaneous expansion and turns to steam, a fibre and/or chip-based shaped part is formed which has a lower overall density but a substantially denser surface than conventional shaped parts of similar type.

Abstract:

DE 3839335 A

(+09.12.87(2),10.12.87(2),29.12.87-JP-311617/8,312499/500, 333221) Wooden decorative objects (I) are mfd. by (a) impregnating a sheet of material (II) with curable resin (III) soln. to form a prepreg sheet (IV), (b) laminating (IV) with small wood chips (V) and (c) during the laminate by heating under pressure. A modification of the process comprises curing and moulding a resin sheet contg. (V) distributed in the matrix, bonding these composite sheets to both surfaces of a backing board to form a decorative multi-wood-effect laminate, cutting or grinding the end of the laminate and bonding another composite sheet to the cut end. In a further modification the cut end is coated with a layer of resin, a one-sided adhesive strip with (V) stuck to one surface is applied so that the wood chips are pressed into the resin layer, and the resin is cured.

USE/ADVANTAGE - (I) are useful for the prodn. of furniture veneers and for interior automobile and household decoration. (I) have adequate strength and high wear resistance, give a bulk wood effect, and can be mfd. with high productivity.

Dwg.0/17

GB 2213427 B

A method of producing a wood containing decorative laminate comprising the steps of: (i) impregnating a material sheet with hardenable resin solution to form a resin solution to form a resin prepregnated sheet; (ii) forming a laminated composite by: (ii)(a) superimposing a plurality of said resin prepregnated sheets to form a superimposed aggregate and, a prescribed number of times, alternately placing firstly small wooden pieces and secondly a further said resin prepregnated sheet on one surface of said superimposed aggregate; or (ii)(b) placing small wooden pieces on one surface of each of a plurality of said prepregnated sheets to form a plurality of resin composites and superimposing said plurality of resin composites; and (iii) hardening said laminated composite by heating under pressure. (Dwg.2/3)

US 4963214 A

Decorative wooden article mfr., involves placing wood pieces upon fibrous sheet impregnated with hardenable resin, and hardening the laminated assembly by hot pressing.

Specifically the fibres are glass, polyamide or polyester, and the resin is epoxy, unsatd. polyester, diallylphthalate, polyurethane, silicone or acrylic, opt. contg. filler such as CaCO₃, talc, TiO₂, silica or glass powder. Specifically wood pieces of ebony, beech, oak, cedar, hinoki, pine or cypress are stabilised by acetic anhydride, polyethylene glycol, or the same resins which impregnate the sheet.

Opt. abrasive particles in the resin are glass, graphite, CaCO₃, MoS₂, BaSO₄, alumina or talc. Opt. the resin contains non-combustible particles of phosphoric acid ester, halide hydrocarbon, antimony oxide or aluminium hydroxide.

USE - Covering furniture, interior decorations, car accessories.

Abstract:

DE 19610079 A

A laminate consisting of (A) a heat-hardenable, resin-impregnated prepreg as the top layer and (B) a rubber or thermoplastic layer of good flexibility, bonded together by (C) a hot melt resin adhesive, is such that: (i) the resin in prepreg (A) is diallyl phthalate, unsatd. polyester, or a phenolic, aminoalkyd, epoxy, acrylurethane or melamine resin; (ii) layer (B) is of chlorinated polyethylene, polybutene, EVA copolymer, ethylene propylene-diene copolymer, polychloroprene, chlorosulphonated polyethylene, styrene-butadiene copolymer or PVC; and (iii) adhesive (c) has m.pt. 60-165deg. C and solubility parameter 7.4-10.9 and is of EVA copolymer, ethylene-acrylic acid copolymer, carboxylated polyethylene, polyurethane, polybutylene terephthalate or a modified EVA copolymer.

USE - Claimed uses are in furniture parts, (kitchen) working surfaces or flooring.

ADVANTAGE - The laminated has outstanding heat resistance, being resistance to cigarette burns or

marking by hot cooking utensils.
